

AI DLP · INSIDER RISK · AUTOMATED INVESTIGATION

CUSTOMER STORY

How Finance Factors cut investigation time by up to **90%** with one view across its security stack

Anzena gave the lender's in-house security team one investigation view across a layered stack of Microsoft 365, SentinelOne, Darktrace, and a zero-trust layer. Day-to-day investigations that once ran as long as two hours now close in five to ten minutes.

90%

faster on day-to-day investigations

Every tool, no full picture

Finance Factors runs the detection stack a regulated lender should: Microsoft 365, SentinelOne, Darktrace, a zero-trust layer. What it never had was one place to answer the question insider risk turns on, what is this one person actually doing. The evidence was all there, spread across four or five consoles, and pulling it together meant doing the work by hand.

EXHIBIT 1 Where the evidence lived

ONE QUESTION · FIVE PLACES TO LOOK

Each tool held one fragment of the story. Answering a single question meant walking all of them and stitching the pieces together, thirty minutes to two hours per case.

I'm a firm believer in defense in depth, and all those tools are great. But we have to go to each one to see certain things, and none of them actually show a full picture.

CHRIS ROBINSON VP OF CYBERSECURITY, FINANCE FACTORS

One view, in practice

Anzenna brought device, user, and file activity into one console, so the picture that once took four or five tools to assemble now opens on a single screen. What used to be a morning of console-hopping became a question the team answers in one place.

Anzenna flagged a bulk set of passport records leaving for an approved AI assistant on a company account. Before, that alert meant opening every console to learn who moved the data, what it was, and whether it mattered. This time the answer sat on one screen: the IT manager, doing his job on a sanctioned vendor. The case closed in minutes.

Finance Factors kept every tool it already trusted and added the one thing it never had, a single view of user activity. Chris Robinson puts the day-to-day gain at 90 percent.

If we see an alert, we can go straight to Anzenna and get the whole picture in one spot, instead of bouncing around all these different consoles.
